0.022
0.144
without pinning: one barrier
further growth (not followed)
uniform
energies schematic, not to scale; $\Omega - \Omega_U$ of the computed states ($\hbar\omega_\perp$) with their line densities below
uniform superfluid
0
S1 first saddle
91.294
M1 pinned minimum
91.272
S2 second saddle
91.416
M2 next minimum
90.549
(b) computed states near the edge
$\Omega - \Omega_U$ ($\hbar\omega_\perp$)
$-\Delta N$ (atoms expelled by the nucleus)
90.272 a_0
90.273 a_0
saddle (index 1)
minimum (index 0)
other branch (index 1)
descent from a saddle
its first 50 steps
order along the path
(c) deficit to the thin-wall limit
$2\sigma - E_b$ ($\hbar\omega_\perp$)
drive $\Delta\omega$ ($\hbar\omega_\perp$ μm^{-1})
σ ($\hbar\omega_\perp$)
